**The main features of large-scale atmospheric circulation in the context of analyzing the consensus forecast of air temperature and precipitation for the 2020 Northern Eurasia summer** / Vilfand R.M., Sumerova K.A., Tishchenko V.A., Khan V.M. // Hydrometeorological Research and Forecasting, 2021, no. 1 (379), pp. 20-35.

The main results of the analysis of the Northern Hemisphere large-scale atmospheric circulation features are presented for the 2020 summer. Skill scores of the consensus forecast for the 2020 Northern Eurasia summer are discussed in the context of analyzing the large-scale atmospheric circulation. The prognostic potential of the trend component in forecasting seasonal anomalies of air temperature and precipitation is noted.

*Keywords:* air temperature, precipitation, forecast skill, trends, large-scale atmospheric circulation, sea surface temperature, NEACOF, circulation indices, Arctic ice
